

## IDAS™ Trunking System Replaces Casino's Previous LTR™ System.

### Background

Ho-Chunk Casino is one of several gambling casinos in Wisconsin, U.S. owned by the Ho-Chunk Nation. It is a large full-service casino that offers 315 hotel rooms, five restaurants and on-site recreation for guests. The casino used to have another manufacturer's 10-channel analog LTR™ system installed in late 1999, which sometimes caused miscommunications due to some audio problems. To correct ongoing problems, Ho-Chunk Casino was looking for a new system to replace its current system.

### Challenge

The biggest requirement of Ho-Chunk Casino was reliable voice communication. The communication coverage should be wide enough to cover the large premises of the casino. Another challenge is effective communications with a trunking system in busy voice traffic. At Ho-Chunk Casino, the staff is divided into a number of talk groups such as security, maintenance, house keeping and the IT department and they need to communicate with each other frequently. In addition, the security of the communication is very important for the casino to avoid cheating in games.

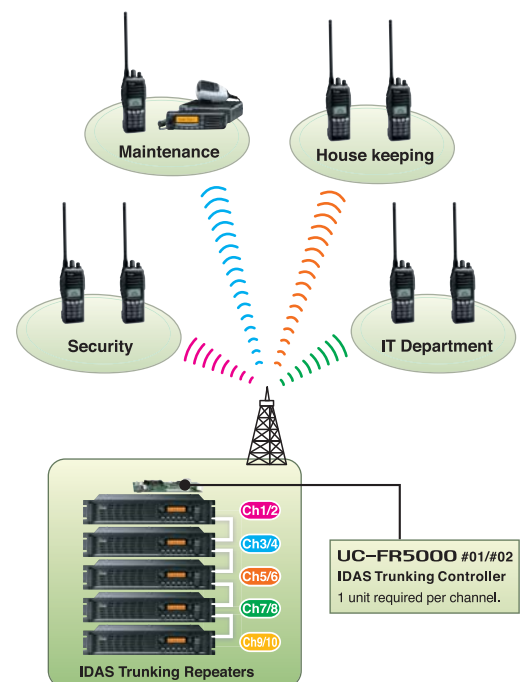

### Solution

The IDAS™ digital trunking system has replaced Ho-Chunk Casino's previous LTR™ system. Being digital, the IDAS™ provides better audio quality, wider communication coverage, and a higher level of security than the previous system. Furthermore, as IDAS™ trunking is similar in approach to LTR™, the casino was able to achieve a smooth migration from its previous LTR™ system to a new IDAS™ trunking system. It also met the casino's requirement that these great features and high quality were available at a reasonable price.

### Conclusion

The IDAS™ digital trunking was a suitable solution for Ho-Chunk Casino. Now the users at Ho-Chunk Casino enjoy smooth communications throughout its gaming, hotel, conference, and entertainment facility.
